ACKNOWLEDGEMENTS

The Employment and Unemployment Survey has been conducted every year by Central Statistical Agency /CSA/ since 2003. The 2016 survey conducted from March 21 to April 20, 2016, is the tenth series. The prime objective of the survey is used as an input for planning, policy formulation and to monitor and evaluate labour programs in urban areas of the country. The total enumeration areas 660 (19,764 of households) were systematically selected from 101 urban centers of the country.

The top management and other staff members have given their unreserved administrative support in facilitating the survey operations. The dedicated professional of CSA staff members and data processing personnel at head office, and the excellent contributions of the staff members of the 25 statistical branch offices were critical to the successful completion of this survey.

The survey would have not been successfully completed without the kind cooperation of the respondents. Field enumerators and supervisors who have discharged their responsibilities in collecting the data under very difficult situations are deeply appreciated.

The CSA particularly acknowledges the following persons who contributed in various ways to the successful preparation and completion of this report:

- Mr. Biratu Yigezu, General Director, CSA
- Mr. Amare Legesse, Deputy General Director, CSA
- Mr. Alemayehu Teferi, Household Surveys and Price Statistics Directorate Director, CSA
- Mr. Teshome Adno, Senior Statistician, CSA
- Mr. Abbay Getachew, Senior Statistician, CSA
- Mr. Getachew Mohammed, Senior Statistician, CSA
- Mr. Sharew Ararsa, Senior Statistician, CSA
- Mr. Salah Yousuf, Senior Methodology Expert, CSA.
- Mr. Mulugeta Okbay, Statistician, CSA
- Mr. Edu Seid, Senior Statistician, CSA
- Mr. Zemecha Abedella, Senior Computer Programmer, CSA

EXECUTIVE SUMMARY

In an effort to provide timely statistical information on the labour market situation of the country, the Central Statistical Authority has launched Continuous Urban Employment and Unemployment Survey program starting from October, 2003 G.C. The survey is planned to be conducted twice every year during the outset but later on since 2006 it was planned to conduct once a year. The data from these series will update the information on employment and unemployment.

The Urban Employment and Unemployment Survey program was designed to provide statistical data on the size and characteristics of the economically active and the inactive population of the country on continuous basis. The variables collected in the survey: socio-demographic characteristics of household members; economic activity during the last seven days and six months; including characteristics of employed persons such as hours of work, occupation, industry, employment status, and earnings from paid employment; unemployment and characteristics of unemployed persons.

All urban centers of the country were considered in this survey, except the three zones of Afar Region and six zones of Somali Region. A total of 19,800 household were selected of which 19,764 households were covered from 660 EA using stratified cluster sample design and the response rate was 99.8 percents. The sample design enables to provide estimates for urban areas of 9 regions and 2 city administration and at national urban level.

The data collection operation of the survey, involved a total of about 357 properly trained enumerators and about 118 field supervisors and 45 statisticians that took place between March 21/2016 to April 20/2016. During the survey data collection operation, close and regular supervision was undertaken at various levels. Spot checks, re-interviewing and a thorough scrutiny of filled-in questionnaires were applied to ensure that the data collection activities being carried out according to the given instruction.

FINDINGS OF THE SURVEY

Background of the population

The survey result estimated the total urban population of the country in April 2016 to be 17,630,393, of which 8,227,792 (46.7 percent) are males and 9,402,601 (53.3 percent) are females. Oromia (29.4%) followed by Addis Ababa City Administration (20.2 percent), and Amahara region (19.7 percent) took the highest share out of the total urban population of the country, while the least percentage is observed for Gambella and Harari region Region (0.8 percent). The children 0-14 shares about 30.3 percent, while the youth 15-29 years make up 36.7 percent, characterizing a young age structure of the population.

According to the survey result, among the total urban population aged 10 years and over, 83.8 percent were found to be literate. The proportion of literates among the males (91.5 percent) is higher than that of the females (77.2 percent). On the other hand, substantially high proportion of the literate (48.3 percent) attained elementary education (Grade 1-8). Regarding training status, out of the total persons aged 10 years and over, about 23 percent were trained. Any sort of theoretical or practical training exercise provided in class or outside class rooms and that has awarded certificate or diploma is considered as training. The proportion of trained males (30.3 percent) exceeds more than twice that of the females 16.9 percent).

Economically Active and Inactive Population

In this survey, economic activity is defined as work, which involves the production of goods and/or services for sale or exchange and production and processing of primary products for own consumption. Usual and current status approaches were used for measuring the economically active population in relation to a short reference period, (seven days) and long reference period, (six calendar months), respectively.

In the usual status approach, persons who have been working for most of the weeks during the six month prior to the survey date were considered as being employed, while those who work for less than 12 weeks or those who did not work at all but who were looking or available for work were counted as being unemployed. For measuring usual economic activity status, priority was given for employed over unemployed and unemployed over economically not active.

The employed population based on the current activity status approach consisted of those who were engaged in productive activity at least for one hours during the seven days prior to the date of the interview. Whereas, the unemployed population consists of persons without work but who are available and ready to work if any job was found. Those who neither engage nor available to work are classified as economically not active. The employed and the unemployed populations together make up the labour force or the current economically active population.

The size of the economically active population of the urban parts of the country in current status approaches are estimated to be 8,938,749 persons with activity rates of 63.3 percent. The activity rate of males is found to be higher than their female counterparts. Regarding the relationship between age and activity rate, the data depicts a curvilinear association. That is, low and increasing participation of persons at a younger age and high and relatively stable for middle ages (between age group 20-54 years) and then a steady decline at older age groups. Higher proportion of females tends to exit the labour force earlier (age 40-44 years) than the males (age 55-59 years).

Looking the activity rates of regions in the last seven days, the highest was reported for Benishangul-Gumuz region 66.8 percent, while the lowest in Somali region compared to other regions i.e., 46.3 percent.

The number of economically inactive persons during the last seven days prior to April 2016 was estimated to be 5,193,325 persons. Being a student (64.4 percent) and homemaking (10.7 percent) and old age (9.7 percent) are the major reasons for inactivity status.

Characteristics of the Employed Population

At country urban level, the size of employed population aged ten years and above was 7,429,522 persons in April 2016 of which the share for males 4,142,866 (55.8 percent) and females were 3,286,656 (44.2 percent)

On the other hand, employment to population ratio provides information on the extent to which the population is engaged in economic activities. It is calculated as the percentage of total employed persons to the total population aged ten years and above. A high employment to population ratio implies large proportion of the population is employed, while low employment to population ratio reflects large share of the population is not involved in economic activities due to unemployment or out of the labour force

According to April 2016 survey, the employment to population ratio of urban population was 52.6 percent. This means about 53.0 percent of the total urban population of the country aged ten years and above are employed. The differential by sex also depict that the ratio of males (64.2 percent) is significantly higher than females (about 43.0 percent).

As the survey result shows, nearly three-fourths of urban employed population are engaged in three equally competent occupations, namely: service, shop and market sales workers (32.1 percent); elementary occupation (17.5 percent), and craft and related activities (15.7 percent). Professional and Technical and associate professionals together stand at the middle of the spectrum (15.4 percent). While those persons working as legislator and managers occupations took the lowest position contributing only about 3.1 percent.

Concerning main activities, most urban people are absorbed by wholesale and retail trade and manufacturing activities, making up 22.3 percent and 13.6 percent, respectively. Those who have worked in other service activities, agriculture, education, construction, private household activities, Transportation and storage, Accommodation occupy an intermediate position, contributing between 6.0 percent to 7.0 percent, in that order. Extra-territorial organizations, mining and quarrying, financial intermediation, health and social work, public administration,, electricity, gas and water supply and real estate, information and communication and professional occupation contributed little in terms of creating employment. More males than females are engaged in most of the activities, except in wholesale and retail trade, manufacturing, private household and hotel and restaurant activities.

In terms of status in employment in urban areas of the country the majority of employed population are paid-employed (49.1 percent) followed by self employed 41.1 percent. Among the paid employees, the by private organization employees took the significant share (20.2 percent) next to government and government development organization together 22.0 percent.

The unpaid family workers also took substantial share (7.4 percent), whereas members of cooperatives, employer and apprentice contributing insignificant share among the total employed population. Relatively more males found in paid employees than female counterparts. However, the proportion of females exceeds a little bit in self-employment domestic employee and unpaid family workers, compared to the corresponding figure among the males.

This survey has collected data on earnings from paid employment. The average amount of earnings for the total paid employees of the country is estimated to be 2,080 Birr per month. In this survey, earnings for employees are related to gross remuneration and include bonus, overtime, allowances and other benefits that are obtained only from the main job. Comparison of mean amount of earning among different sectors (industries) has shown that the highest payments are given to those who were working in financial insurance activities (3,591 Birr) followed by extra territorial organizations (3,505 Birr) per month. Employees working in private households and accommodation and food service activities earn the least payment, i.e., with 527 Birr and 956 Birr per month, respectively.

Another information collected in this survey was the informal/ formal nature of employed persons. Persons who work in an enterprise or business that did not keep book of account, who did not have license and mainly produced for the market were considered to be working in the informal sector. Note that as per the definition from ICLS, resolution in 1982, persons engaged in subsistence farming and those who work in private households were neither considered as formal or informal activities and excluded from the analysis.

According to the survey result, at urban country level a total of 1,657,880 people were engaged in the informal sector, making up 26.5 percent of the total employment. The highest proportion of employed population who work in the informal sector was recorded for Somali Region (36.4 percent) followed by Afar (34.1 percent). The lowest proportion, in this respect was registered by Addis Ababa City Administration (10.5 percent). A higher proportion of (35.6 percent) females than males (about 20 percent) were engaged in the informal sector at national urban level. This holds true in all regions.

Levels and Distribution of Unemployment

The unemployment rate, which is computed as the proportion of the unemployed persons out of the economically active population, can be used to measure the level of unemployed population of an area. The survey result reveals that in April 2016, there were 1,509,227 unemployed persons, out of which males are 428,250 and females are 1,080,997. This means that the rate of unemployment in the current status approach for urban areas of the country is 16.9 percent. Similarly, unemployment among the male and female are 9.4 percent and 24.7 percent, respectively.

Regarding the age pattern of unemployment, the rates are higher for the younger age groups than the older ones. Nearly one-fourths (22%) of the youth population ages 15-29 years were

unemployed during the reference period. The rates then show general declining pattern and remains below 15 percent after age group 30-34 years.

The result depicts that unemployment rate is highest in urban areas of Dire Dawa Administrative Council (23.9 percent) followed by Addis Ababa City Administration (21.0 percent), Tigray Region (20.6 percent) and Afar Region (19.0 percent). Also, in urban areas of Somali Region unemployment rate is found to be 18.2 percent closely followed by Amhara region about 18.0 percent. While in the rest of urban areas of regions unemployment rate ranged from 8.2 percent in Gambella Region to 15.2 percent in Oromia Region.

The rate of unemployment by educational attainment at country urban level shows . the highest rate of unemployment (34.1 percent) was recorded for those with primary education and secondary education completed (23.7 percent) and 16.3 percent registered for above secondary education together. The lowest unemployment rate was registered for persons who attained non-formal education (1.6 percent). With regard to sex, females found to be more unemployed than males in primary level and non-formal education. Also more literate than illiterate unemployed was observed (76 percent against 14 percent) in April 2016 survey period.

Urban unemployed population who wanted to establish their own business reported that shortage of finance is the main problem they have faced, accounting for about 62 percent. The next important reason is lack of working place /land, which constituted about 14.0 percent.

Out of the total urban unemployed persons in urban areas of the country, 47.7 percent had no work experience and 52.3 percent have had previous work experience prior to the survey date. Among those unemployed persons who had prior work experience, males are higher than females, where as female unemployed are more dominant than male among those without previous work experience.

The survey also revealed that 37.8 percent of the unemployed persons are jobless for about 12 months and 12.2 percent stay jobless for two years. The unemployed persons who stay without jobs for 96 months and above, accounts 28.8 percent in April 2016.

Among unemployed population those who attempt to establish their own business were asked to state what problems they have faced. As the table shows that more than 50 percent of the unemployed persons faced shortage of finance is the main barrier to set up their own business. Lack of working place and finance accounted to be 13.3 percent.

It appears that unemployment remains high and stable in urban Ethiopia during the last 10 years. The unemployment rate has been declined from 20.4 percent in 2009 to 16.9 percent in April 2016. The rate in the latest survey periods is the same level as that observed in 2015 (16.8 percent).

CHAPTER I

BACKGROUND OF THE SURVEY

1.1 Introduction

Statistical information on all aspects of the population is vital for the design, implementation, monitoring and evaluation of economic and social development plan and policy issues. Labour force survey is one of the most important sources of data for assessing the role of the population of the country in the economic and social development process. It is useful to indicate the extent of available and unutilized human resources that must be absorbed by the national economy to ensure full employment and economic well being of the population. Statistics on the labour force further present the economic activity status and its relationship to other social and economic characteristics of the population. Seasonal and other variations as well as changes over time in the size, distribution and characteristics of employed and unemployed population can be monitored using up-to-date information from labour force surveys. It serves as an input for assessing the achievements of the post 2015 Sustainable Development Goals (SDGs). Furthermore, labour force data is also useful as a springboard for monitoring and evaluation of the second five years growth and transformation plan/GTP- 2/ of the country.

Despite the significance of the labour force data, the availability of reliable and timely labour force data were inadequate. The lack of reliable and timely data on different aspects of the population hinders the monitoring and evaluation of changes of developmental activities.

The Central Statistical Agency (CSA) has been providing labour force and related data at different levels with various contents and details in order to fill the gap in data requirement for the purpose of planning, monitoring and evaluation. These include the 1976 Addis Ababa Manpower and Housing Sample Survey, the 1978 Survey on Population and Housing Characteristics of Seventeen Major Towns, the 1980/81 and 1987/88 Rural Labour Force Surveys (RLFS). The 1984, 1994 and 2007 Population

and Housing Censuses and the 1999, 2005 and 2013 National Labour Force Surveys provided a comprehensive national labour force data representing both urban and rural areas.

Considering the development process of the country and dynamic nature of the sectors and fulfilling the demands of different data users, the CSA has been launched Urban Employment Unemployment Survey program (UEUS) since 2003. The Agency conducted UEUS in tenth rounds.

The statistical and analytical reports were published together in 2003, 2004 and 2006, while from 2009 to 2012 published separately. Thereafter, only the statistical reports were published. For the purpose of providing summary report for policy makers and planners, the CSA also began to publish key findings of the survey result since 2010.

For the purpose of capturing information on economic participation of children, the former minimum age limit 10 years was lower down to 5 years since 2005. Every person aged five years and above in the sampled household was asked if he/she was engaged in any economic activities during the last seven days, and the last six months prior to the survey date. This is because children in rural and urban areas used to work at their early age such as collection of fire wood, looking after cattle, shoeshine, street vendor, petty trading...etc. However, based on Ethiopian situation, the lower age limit for measuring the economic activity status was fixed into ten years. . This statistical report is therefore mainly aimed at provide information on the economic characteristics of the population aged ten years and above.

This statistical report presents a brief introduction of each chapter including basic concepts based on ILO standard definitions together with statistical tables.

1.2. Objectives of the Survey

The general objective of the 2016 Urban Employment and Unemployment Survey is to provide statistical data on the distribution, characteristics and size of the economic activity status i.e. employed, unemployed population of the country at urban levels on annual basis. The specific objectives of the survey are to:

- collect statistical data on the potential manpower and those who are available to take part in various socio-economic activities;
- update the data and determine the size and distribution of the labour force participation and the status of economic activity for different sub-groups of the population at different levels of the country; and also to study the socio-economic and demographic characteristics of these groups;
- identify the size, distribution and characteristics of employed population i.e. working in the formal or informal employment sector of the economy and earnings from paid employees by occupation and Industry...etc;
- provide data on the size, characteristics and distribution of unemployed population and rate of unemployment;
- provide data that can be used to assess the situation of women's employment or the participation of women in the labour force;
- generate annual time series data to trace changes over time;

1.3. Content and Organization of Survey Questionnaire

The questionnaire was organized in to six sections;

Section - 1: Area identification of the selected household: this section dealt with area identification of the respondents such as region, zone, wereda, etc.

Section - 2: Socio- demographic characteristics of households: it consisted of the general socio-demographic characteristics of the population such as

age, sex, education, status and type of migration, disability, literacy status, educational Attainment, types of training and marital status.

Section – 3: Economic activities during the last seven days: this section dealt with a range of questions which helps to see the status and characteristics of employed persons in a current status approach such as hours of work in productive activities, occupation, industry, status in employment, earnings from employment, job mobility, service year for paid employees employment in the formal and informal sector and time related under employment.

Section – 4: Unemployment and characteristics of unemployed persons: this section focused on the size, rate and characteristics of the unemployed population.

Section – 5: Economic activities during the last six months: this section consists of the usual economic activity status refereeing to the long reference period i.e. engaged in productive activities during most of the last six months, reason for not being active.

A structured questionnaire was used to solicit the required data in the survey. The draft questionnaire was tested by undertaking a pretest in selected kebeles (lower administrative unit) in Addis Ababa. Based on the pretest, the content, logical flow, layout and presentation of the questionnaire was amended. The questionnaire used in the field for data collection was prepared in Amharic language. Most questions have pre coded answers and column numbers were assigned for each question. A copy of the questionnaire translated in English language is attached as Annex I of this report for reference.

1.4. Training of Field Staff

The training program of enumerators, supervisors, statistician and other field staffs conducted from March 7-16 /2016. To maximize the data quality, the training was given at four training centers in Nekemte, Arba Minch, Dessie and Harar towns for

ten days. It was also given by head office senior professionals. The trainees were selected from CSA head and branch offices and from those who have long time experience in data collection.

The training was guided by an enumerator and supervisor manuals, which consists of detailed explanation of concepts, ideas and instructions on how to fill each entry in the questionnaire. It was accompanied with theoretical classroom discussions on concepts, definitions and techniques of completing the questionnaire as well as mock interview. The class room presentation and discussions were intended to exchange experiences among participants and pinpoint the areas of the survey questions that need more care and attention. The objectives of mock and practical interviewing of households were twofold. First, it enabled to assess how well the classroom theoretical discussions were understood by all participants to convey the same message at all levels. The second objective was to examine the difficulty, which would likely be encountered during actual field work. At the end of the training, one day field practice was carried out to familiarize on the contents and structure of the questionnaire through interviewing of household members followed by general discussion.

Following the accomplishment of the training program, the tenth series of the 2016 Urban Employment and Unemployment Survey conducted from March 21 to April 20, 2016.

1.5. Organization of the Fieldwork

In order to carry out this survey with the desired level of quality, there was a need to organize a large staff that performs the various survey activities. The 25 Branch Statistical Offices of the Agency were responsible to carry out the data collection operation. These offices have permanent and contract enumerators stationed in the selected enumeration areas. The data collection operation of the survey involved a total of about 520 of which 357 were enumerators, 45 statisticians and 118 field supervisors with an average supervisor to enumerator ratio of 1: 3.

The interviews have been done by canvassing from house-to-house. Information was collected directly from the head of the household or from other responsible household member. The enumerators were assigned to **two** sampled enumeration area, where he/she could easily converse with the respondent's dialect. However, in some cases whenever enumerator faces difficulty to converse with the respondent's dialect interpreters were used to facilitate the data collection.

Data collection from the field took place from March 21 to April 20, 2016. During the survey data collection operation, close and regular supervision was undertaken at various levels. Immediately after the commencement of the data collection exercise the supervisors had made spot checking, re-interviewing and a thorough scrutiny of filled-in questionnaires to ensure that the data collection activities are taking place according to the given instruction. The branch statistical office heads, coordinators and statisticians were also made supervision of the data collection operation. Moreover, senior staff members from the CSA head office made field supervision activities in seven branches for a week at different towns.

All branch statistical offices of the CSA participated in the survey process undertaken, that is, in organizing the field survey in deploying the field staff to their respective sites, and retrieving completed questionnaires and submitting them to the head office. They will also responsible in administering the financial and logistic aspect of the survey as well as field supervision within the areas of their assignment.

1.6. Data Processing

The filled-in questionnaires that were retrieved from the field were first subjected to manual editing and coding. During the fieldwork, field supervisors and statisticians of the head and branch statistical offices have checked the filled-in questionnaires and carried out some editing. However, the major editing and coding operation was carried out at the head office. All the edited questionnaires were again fully verified

and checked for consistency before they were submitted to the data entry by the subject matter experts.

Using the computer edit specifications prepared earlier for this purpose, the entered data were checked for consistencies and then computer editing or data cleaning was made by referring back to the filled-in questionnaire. This is an important part of data processing operation to maintain the quality of the data. Consistency checks and re-checks were also made based on frequency and tabulation results. This was done by senior programmers using CSPro software in collaboration with the senior subject matter experts from Manpower Statistics Team of the CSA.

1.7. Definitions of Concepts and Terms

Some of the major operational definitions of basic concepts are given below. Moreover, other concepts and definitions related to the economic activity status are provided under respective chapters.

Urban Center: is defined as a locality with 2000 or more inhabitants. In this survey, however, for practical purposes an urban center includes the following regardless of the number of inhabitants.

- a) All administrative capitals
 - i) Regional capitals
 - ii) Zonal capitals not included in (i)
 - iii) Wereda capitals not included in (i) and (ii)
 - iv) Localities with Urban Dweller's Association (UDAs) not included in (I-iii).
- b) Municipal town not included in item (a) above.
- c) All localities which are not included either in item (a) or (b) above, having a population of 1000 or more persons, and whose inhabitants are primarily engaged in non-agricultural activities. Note that localities with population less than 1000 persons should be considered as rural.

Major Urban Centers: For the purpose of this study, major urban center include those selected urban centers with population 100,000 and above. It also includes region capitals irrespective of their population size.

Urban Kebele: is the lowest administrative unit in an urban center with its own jurisdiction. It is an association of urban dwellers (commonly known as kebele) formed by the inhabitants.

Enumeration Area (EA): is a unit of land delineated for the purpose of enumerating population and housing units without omission and duplication. An EA in rural areas usually consists of 150-200 households. On the other hand, an EA in urban areas constitutes 150-200 housing units.

Household: Consists of a person or group of persons, irrespective of whether related or not, who normally live together in the same household and housing units and have common cooking and eating arrangements.

Housing Unit : is defined as a separate and independent place of abode either intended for habitation or not intended for habitation but was occupied as a living quarter by a household during the survey period. Although intended for habitation by one household, a housing unit may, at the survey be occupied by one or more households or may be used partly for living and partly for establishment.

Head of Household: is a person who provides economic supports or manages the households. The head of the household is selected by household members for some reasons of his age or respect regardless of their sex.

Usual Member of a Household: a person is considered as usual members of a household if he or she is:-

- a) a person who continuously live/reside at least for six months and have a common cooking and eating arrangements with the household; or
- b) a person who is temporarily absent from the household at the time of the survey but his absence has not violated the six months criterion.
- c) House maids, guards, baby sitters, etc...with no other dwelling and who were staying with the household at the time of the survey.
- d) Persons who plan to live more than six months due to searching for job and transfer from job ...etc.

1.8. Organization of the Report

This statistical report contains six chapters. The first chapter covers background and objectives of the survey, where the objectives and the contents of the survey questionnaire, training of field staff, organization of field work, definitions of terms and

concepts. Chapter II presents methodology of the survey including scope, coverage, sample size, covered households and response rate. Chapter III describes briefly the socio-demographic characteristics of the urban population such as the size and distribution of urban population by age group and sex. Chapter IV presents data on the economic activity status of the population aged ten years and above using the current status approach. Chapter V and VI explores the size, characteristics and distribution of the employed and unemployed population aged ten years and above, respectively.

Annex I provides survey questionnaire in English version, while estimation procedures of total, ratio and sampling errors; and estimates and CV's are also presented in Annex II and Annex III, respectively.

CHAPTER II

SURVEY METHODOLOGY

2.1 COVERAGE

The 2016 Urban Employment and Unemployment Survey (UEUS) covered all urban parts of the country except three zones of Afar, Six zones of Somali, where the residents are pastoralists. This survey follows household approach and covers households residing in conventional households, thus population residing in the collective quarters such as universities/colleges, hotel/hostel, monasteries and homeless population etc are not covered by this survey.

It was initially planned to cover 660 EAs and 19,800 households in the survey, but ultimately 19,764 (99.8%) of households were successfully covered.

2.2 SAMPLING FRAME

The list of households obtained from the 2007 population and housing census is used to select EAs. A fresh list of households from each EA was prepared at the beginning of the survey period. The list was then used as a frame in order to select 30 households from sample EAs.

2.3 SAMPLE DESIGN

For the purpose of this survey, the country was divided into two broad categories. That is major urban center and other urban center categories.

Category I:- Major urban centers:- In this category all regional capitals and five other major urban centers that have had a high population size as compared to others were included. Each urban center in this category was considered as a reporting level. The category has a total of 16 reporting levels. In this category, in order to select the sample, a stratified two-stage cluster sample design was implemented. The primary sampling units were EAs of each reporting level. From each sample EA 30 households were then selected as a Second Stage Unit (SSU).

Category II: - Other urban centers: Urban centers in the country other than those under category I were grouped into this category. A domain of other urban centers is formed for each region. Consequently 8 reporting levels were formed in this category. Harari, Addis Ababa and Dire Dawa do not have urban centers other than that grouped in category I. Hence, no domain was formed for these regions under this category.

A stratified three stage cluster sample design was also adopted to select samples from this category. The primary sampling units were urban centers and the second stage sampling units were EAs. From each EA 30 households were selected at the third stage and the survey questionnaires administered for all of them.

2.4 SAMPLE SIZE AND SELECTION SCHEME

Category I: - In this category 393 EAs and 11,790 households were selected from 16 major urban centers. Sample EAs from each reporting level in this category were selected using probability proportional to size /PPS/ with systematic sampling method; size being number of households obtained from the 2007 population and housing census. From the fresh list of households prepared at the beginning of the survey, 30 households per EA were selected using systematic random sampling techniques /SRS/.

Category II:- consists of 86 urban centers, 267 EAs and 8,010 households were selected in this category. Urban centers from each domain and EAs from each urban center were selected using probability proportional to size /PPS/ with systematic sampling method; size being number of households obtained from the 2007 Population and housing census. From the listing of households in each EA then 30 households were selected using systematic random sampling techniques /SRS/ and the survey questionnaire was administered for the 30 sample households.

The distribution of planned and covered EAs and households and the Estimation procedures are given in the appendix.

**Appendix I: Number of planned and actually covered sampling units
(EAs and households) of the 2016 (2008 E.C) Urban Employment
and Unemployment Survey (UEUS).**

CHAPTER III

SOCIO-DEMOGRAPHIC CHARACTERISTICS OF URBAN POPULATION

3.1 Introduction

The figure in this chapter refers to the de jure population residing in conventional households. The de jure population comprises all persons who belong to a given area at a given time by virtue of usual residence. Thus, excluded are visitors, persons residing in collective quarters (hotel/hostel, boarding schools, prisons...etc.) as well as homeless persons.

This chapter presents the basic socio-demographic characteristics of urban population of the country which includes estimates of population size; distribution of population by age and sex, sex ratio, relationship to the head of household, Number of households and household size, literacy status, attending formal or informal education, educational attainment, training status and type of training.

3.2. Age-Sex Structure of Urban Population and Other Socio-Demographic Data

This section portrays a set of tables that depict the main socio-demographic characteristics of the urban population. The total urban population of the country estimated to be 17,630,393 in March. 2016. The size and distribution of estimated total population of urban areas by age group, sex and region is shown in Table 3.1. Table 3.2 presents the distribution of urban population, number of households and average household size by region. The average household size is computed from the total population to that of the total households. Data on household size and distribution of persons per household can sometimes be used as a proxy measure of crowdedness of population and has a great implication to health and housing problem. The distribution of urban population by region, sex and the relationship of the respondents to the head of household are presented in Table 3.3.

Table 3.4 and Table 3.5 show the status of school attendance for those aged five years and above by age group and sex at national and regional levels. The literacy status and educational attainment of urban population aged ten years and above has shown in Table 3.6 and Table 3.7, respectively. As indicated in these tables secondary education refers to those persons who did not complete high school education, that is, grades 9 - 11 in old curriculum and grade 9 in new curriculum, while secondary education completed covers those persons who completed high school education which includes grade 12 in old curriculum and grade 10 in new curriculum.

The 2016 Urban Employment and Unemployment Survey also collected data on status and types of training of urban population aged ten years and above. Tables 3.8 reveal the status and type of training received by region and sex.

Besides, the distribution of urban population by five-year age group, sex and sex ratio is presented in Table 3.9. Sex ratio is defined as the number of males per 100 females in a given population. The sex composition has an effect on economic activities through changing the relative size of the working population.

CHAPTER IV

ECONOMIC ACTIVITY STATUS

4.1 Introduction

Statistical data on the economic activity status of a population is essential for planning and formulating policies for better utilization of human resources of a country. The economic activity status indicates the size and distribution of the work force of economically active and not active population during a given reference period at a specified area.

In this regard, a wide range of information was collected on economic activity status of all persons aged five years and above in the 2016 UEUS. For the purpose of gathering information about the economic activities of children, the lower age limit was fixed at five years and hence data were collected from persons aged five years and above. However, for the purpose of measuring the economic activity status of adult population according to the Ethiopian situation, the lower age limit was fixed into ten years.

The 2016 Urban Employment and Unemployment Survey administered detailed labour force questions to measure the economic activity status of persons in urban areas of the country. These includes:-

- whether persons were engaged in economic / productive activities in the last seven days prior to the survey date or reasons for not being engaged;
- whether persons were looking for work or will be available for work in the coming one month or reason for not being available during the reference period; and
- whether persons were engaged in economic / productive activities during most of the last six months or reasons for not being engaged.

Every person aged ten years and above in the sampled household was asked if he/she was engaged in any productive activities during the last seven days, and in the last six months prior to the survey date. Based on the response obtained from respondents, the economic activity status of the population was determined by using the standard definitions of economic and non economic activities.

The 2016 Urban Employment and Unemployment Survey followed the ILO international standard definitions of economic and non-economic activities. The concept of economic activity as adopted by the 13th International Conference on Labour Statistics (ICLS,1982) is defined as the production of goods and/or services that falls within the United Nations System of National Accounts (SNA) production boundary (ILO, 1990). In this survey, economic/ productive activity is defined as work, which involves the production of goods and /or services for sale or exchange. In addition, production of goods and services for own consumption or own uses are also considered as economic activities. These include production of primary products (agriculture, hunting, fishing, forestry and logging, mining and quarrying), for own consumption; processing of primary products by the producers themselves; production of other commodities where part of it is sold on the market; and own account construction and fixed asset formation (expected life use of one year or more). Such economic activities could be performed for an individual, family or private enterprise, government establishment or social organization. The remuneration may be on daily, weekly, monthly, yearly or contract basis. The practical activities of apprentices are also considered as economic activities. On the other hand, unpaid household chores such as preparing food, cleaning the house, taking care of children are not considered as economic activities. Similarly, unpaid community and volunteer services are classified as non-economic activities.

Based on the above ILO definitions, data on economic activity status of persons aged ten years and above was presented in this report. Persons who were engaged in productive work /employed/ or available to be engaged /unemployed/ during the reference period are considered as economically active persons. While those persons who were neither

engaged nor available to be engaged in the production of economic goods and services during the reference period are considered as population not economically active.

4.2 Data Collection Approaches

The Survey used two approaches in the collection of data about the economic activity status of the population. These are current and usual activity status approaches. The main difference between these two approaches is the length of the reference period.

4.2.1 Current Activity Status Approach

The current activity status approach measures the economic activity status of a person based on a short reference period of seven days before the date of interview. In this approach, all persons aged ten years and above who were engaged in productive work or available to be engaged during the reference week were considered as currently active while those who were neither engaged nor available to be engaged in productive work were taken as currently not active.

4.2.2 Usual Activity Status Approach

The usual activity status approach measures the economic activity status of a person based on a long reference period of the six months prior to the date of interview. In the usual activity status approach, all persons aged ten years and above who were engaged in productive works or available to be engaged in the production of economic goods and/or services during most of the six months were classified as usually active. Persons who were neither employed nor unemployed during most of the six months categorized as usually not active.

The choice of appropriate measurement approach depends on the extent of variability of economic activities of the population during a specified period in a given the study area. In the rural areas where seasonal variation of activities is common, to collect the economic activity status of the rural population including the slack and peak periods of

agricultural activities, a longer reference period (usual activity status approach) is found to be more appropriate. On the other hand, in urban areas, activities are relatively less affected by seasonal variations and hence shorter reference period or current activity status approach is found to be more convenient. But in this survey, both approaches were used to collect data on economic activity status of urban population.

This chapter presents the economic activity status aged ten years and above, size and distribution of economically active and not economically active urban population, activity rate, and reasons for not being economically active of urban population by using only the current status approach at national, regional and major town levels.

4.3 Current Activity Status

As mentioned above, current activity status approach measures the economic activity status of a person in a short reference period, that is, the seven days prior to the date of the interview. In this approach a series of inquiries were administered to determine the economic activity status of the population during the reference week such as engagement in economic activity, attachment to the job, seeking and availability to work, reason for not seeking or available to work, etc. These questions were presented to those persons aged five years and above. For the purpose of reporting, persons aged ten years and above were used to classify the population into three mutually exclusive categories: employed, unemployed, and not in the labour force (Not Economically active). The employed and the unemployed population together constitute the labour force or the currently active population. The third category, those who were not in the labour force are called not currently active population.

As part of the economically active population, employed population consists of persons aged ten years and above who engaged in a productive activity or work at least for one hour during the seven days prior to the date of the interview. In addition, persons who had regular jobs, or business, or holdings to return to but who were temporarily absent from work (not at work or worked less than one hour) for various reasons such as illness or injury, holiday or vacation, strike or lockout, and seasonality of work, annual leave, temporary closure of establishment were also considered as employed. For a

person to be considered as absent from work, he/she must have formal attachment to the job.

The currently unemployed population also comprises those persons without work but looking for work or available and ready to work if any job is found during the reference period of the coming one month. The reference period of the coming one month refers to the survey week plus the next three weeks. If a person who is looking for work but engaged in productive activity during the reference week is recorded as employed but not as unemployed.

4.4 Economically Active and Not active Population and Activity Rate

Based on the above definition of economic activity status, the number of economically active population including employed and unemployed persons, population not active and activity rates of urban population aged ten years and above at national and regional level is presented by sex and age group in Table 4.1 and Table 4.1.1- 4.1.11 using the current status approach, respectively. Besides, the economic activity status and activity rate of selected major towns' population aged ten years and above is also presented in Table 4.2.

The extent of the economic participation of the population is measured using economic activity rates. Economic activity rate or economic participation rate is computed as the percentage of the economically active population over the total of active plus not active population aged ten years and above. The national estimate shows that 63.3 percent of the population aged ten years and above were economically active (Table 4.1). With respect to sex, the activity rate of male is 70.9 percent and the corresponding female activity rate is 56.8 percent. The age distributions of activity rate illustrate that it is low at younger and older age groups. The table also shows a relatively stable for middle ages between 20-59 years, and reaches its peak in age groups 30-39 (Table 4.1).

As far as the economic activity status of major towns' population is concerned, 63.2 percent of the populations were economically active while the remaining 36.8 percent were found to be the population not economically active. In terms of sex, the activity rate of male (71.3 per cent) was higher by 14.7 per cent than female (56.6 per cent). Among the major towns, the highest activity rate was recorded in Bahir Dar town (72.7 per cent) while the lowest was for Jijiga town (47.3 per cent) (Table 4.2).

The size of economically active and not active population has its own implication on the development of the local as well as the national economy of a region. The high activity rate of a population implies the prevalence of huge potential of the human resource or human labour that foster sustainable economic development. On the other hand, the low economic activity rate also implies the lack of adequate and trained human labour or the existence of large number of economically non-productive population which has no contribution for development at the time. Hence, the economic activity rate of the urban population of the Ethiopia can be viewed from these perspectives.

The distribution of economically not active population of urban areas at national and regional level by age group, sex and reason for not being economically active (for those who were neither engaged nor available and/ or seeking work) during the last seven days are presented in Table 4.3 and Table 4.4, respectively. The reasons for not looking for or available to work include; home maker, pregnancy, student, injury/ disability, illness, too young, old age, pensioned, remittance, and other reasons. The result in Table 4.3 shows that the lion share of the population not active were students for the national (64.4 per cent). The remaining per cent was the other groups of reasons for the economically not active population. The same holds true for the regions, too (Table 4.4).

CHAPTER V

CHARACTERISTICS OF THE CURRENTLY URBAN EMPLOYED POPULATION

5. 1. Introduction

The previous chapter has defined the economically active population to be the sum of the employed and the unemployed population. This chapter presents statistical data on the size, distribution and characteristics of the currently employed population based on the definition given in chapter IV. The survey has collected the following information regarding the characteristics of the currently employed population:

- a) Main type of occupation;
- b) Main product or service of the establishment or industry;
- c) Employment status of the main activity and terms of employment;
- d) Reasons for absence from work for those employed persons who worked less than one hour or does not work at all but have formal job attachment during the reference period;
- e) Amount of earnings from paid employees;
- f) Hours worked per week and
- g) Whether employed persons were available or seeking to work additional hours.
- h) Sector of the economy (Formal or informal employment sector);

5.2. Employment to Population Ratio

According to the 18 Key Indicators of Labour Market (KILM) used by the ILO, employment to population ratio is calculated as a percentage of total employed persons to that of the working age population (ILO, 1999). The distribution of employment to population ratio of urban areas of each region by age group and sex is shown in Table 5.1. The data for employment to population ratio of each selected major towns by age group and sex is presented in Table 5.2.

5.3. Occupation and Industry

In this survey, the currently employed persons were asked about the type of main activity or occupation and major product or service of the establishment or industry in which they were engaged during the survey reference period. The questions used to identify the type of occupation and industry, were left open ended so that they will be filled in with the fullest description and its code in the field. For those employed persons engaged in multiple activities, the activity that took the largest share of the respondents' time was taken as the main type of activity.

The responses of the descriptions and codes for the type of occupation and industry filled in by enumerators were further checked and edited at the head quarters using the National Occupational and Industrial Classifications (NOIC) code-book. The NOIC codes were adopted from the International Standard Classification of Occupation (ISCO-08) and International Standard Industrial Classification (ISIC, Revision 4) by taking into account the prevailing national socio-economic conditions.

The NOIC uses a 4-digit coding systems corresponding to 4 level classifications in successively finer detail. In the cases of occupation and industry, the levels are ordered as major divisions, sub major divisions, minor divisions and unit divisions. The occupational classification was categorized into 9 major groups, 42 sub major groups, 132 minor groups and 467 unit groups. The industrial classification contains 21, 88, 238 and 425 major, sub major, minor and unit divisions respectively.

The distribution of employed population of urban areas by major occupational groups, age group and sex for the country total and each region is presented in Table 5.3 and 5.4, respectively. Table 5.5 presents the distribution of employed population by major occupation, sex for each selected major towns. The distribution of employed population by minor occupational groups for each region classified by sex appears in Table 5.6. One should note that in Table 5.6 and 5.10 major and sub major occupation and industrial classification are written in capital letter, while minor occupation and industrial classification are written in small letter, respectively. Analogous information, which deals with the industrial divisions are also shown in Table 5.7 to 5.10.

5.4. Status in Employment

Employment status of a person indicates the level of involvement and degree of decision-making in his main activity. In this survey employed persons were asked about the employment status of their main activity which was classified into: employer, paid employees, self-employed, unpaid family worker, apprentice, and member's of producers, cooperative and others categories. Paid employees were further disaggregated into employees-government, employees government parastatal, employees NGO's, employees private organization, employees domestic and other paid employees.

Table 5.11 and Table 5.12 present the distribution of status in employment by age group and sex for urban areas of country and each region. The distribution of status in employment for major towns classified by sex is presented in Tables 5.13. Table 5.14 contains data on major occupational groups cross classified by major industrial divisions and sex for urban areas of the country total. The status in employment by major industrial divisions and sex for a country total is shown in Table 5.15. Also, the figures for status in employment classified by major occupation and sex for country total are presented in Table 5.16.

5.5. Number of Hours worked

The absence of standard working hours and irregular nature of working days in the informal sectors or in the self employment, data collection as well as getting accurate data on hours of work were found to be difficult. In addition, the reliability of the data collection is likely to be affected due to memory lapse and lack of knowledge or information about the concepts of time on the part of the respondent. Thus, considering the inherent data collection problem on hours of work in developing countries, the figures presented in these tables should be regarded as indicative and not the true levels of intensity of work.

The 2016 Urban Employment and Unemployment Survey included questions on the number of hours worked for two purposes. First, the response on the number of hours worked during the seven days prior to the date of the interview is used to classify the respondents as employed or not on the basis of the given criteria of the minimum required hours of work. As described in Chapter IV, persons who worked at least one hour or more, and those who were not worked or worked less than 1 hour but had a job to return to were considered as employed. The remaining persons were then asked a filtering questions of unemployment and not active. The second objective of including questions on number of hours worked was to gather data on intensity of work among the employed population.

In this survey, all persons who were engaged in productive activities during the seven days prior to the date of interview were asked to provide the number of hours they worked in all productive activities. The response was recorded for each of the days in a separate notebook so as to get the total actual hours of work during the reference week. Then the hours so obtained were added together for the week and finally filled in the main questionnaire.

According to the resolution concerning statistics on hours actually worked that adopted by the tenth ICLS in 1962 (ILO, 1976), in this survey, the hours actually worked included:

- a) Hours actually worked during normal periods of work and time spent for waiting for the market;
- b) Time worked in addition to hours worked during normal periods of work, and generally paid at higher rates than normal rates (overtime);
- c) Time spent at place of work on activities such as the preparation of the work place; repairing maintenance, preparing and cleaning of tools and others;
- d) Time spent at the place of work waiting or standing by for such reasons as lack of supply of work, break down of machinery, or accidents, or time spent at the place of work during which no work is done but for which payment is made under a guaranteed employment contract and
- e) Time corresponding to short rest periods at the work place including tea and coffee breaks;

According to the resolution in recording the number of hours worked, care was taken to exclude hours paid for but not worked, such as paid annual leave, paid public holidays or paid sick leave. Also excluded are meal breaks, time spent on travel from home to work and vice versa /for those who have specified place of work/, and hours spent on household activities that were not considered as productive. For employed persons who were not at work during the seven days prior to the date of interview, the number of hours of work is recorded as zero. On the other hand, any time that employed persons have spent in productive activity in places other than work site is considered as working hour.

Table 5.17 presents the distribution of the number of hours worked during the last seven days by age group and sex at country urban level. Similarly, the distribution for each region classified by sex appears in Table 5.18. The distribution of number of hours worked by major industrial divisions, major occupation, and status in employment for country total disaggregated by sex are shown in Table 5.19, 5.20 and 5.21, in that order.

5.6. Earning from Paid Employment

Paid employment jobs are those jobs where the employees hold explicit (written or oral) or implicit employment contracts, which give them a basic remuneration. Some or all of the tools, capitals equipment, information systems and/or premises used by the employees may be owned by others, and the employees may work under direct supervision or according to the strict guidelines set by the owner(s) or persons in the owners' employment. Persons in "paid employment" jobs are typically remunerated by wages and salaries, but may be paid by commission from sales, by piece rates, bonuses or in kind payments such as food, housing or clothing. In this survey, earnings for paid employees refer to gross remuneration and include bonus, overtime, allowances and other benefits that are obtained only from the main job.

Table 5.22 shows the distribution of paid employees disaggregated by types of payment and sex for urban areas of each region. The distribution of paid employees in urban areas by sex and period of payment and sex at country level is presented in Table 5.23. The distribution of paid employees in urban areas of the country classified by amount and period of payment and sex is presented in table 5.24. Paid employees of urban areas of the country by major industrial divisions, sex and amount of payment per month has also shown in Table 5.25.

5.7. Absence from Work

Employed persons that were considered to be absent from work were those who were not engaged in any productive activity or who work less than one hour during the seven days prior to the date of the interview but have formal job attachment. These persons were asked their main reason for being absent from work. Reasons for absence from work was classified as illness, holiday /vacation, Training/education, off-season, reduction in economic activity and “others” categories. The data presented in Table 5.26 indicates the distribution of employed population for their reasons for being absent from work by region and sex.

5.8. Availability to Work Additional Hours

This survey collected data on time related under employment in an attempt to capture the insufficiency of the hours of work of employed persons in relation to an alternative employment situation in which persons are willing and available to be engaged in. The response of employed persons depending on their availability and readiness or not to work for additional hours was coded as “yes” or “no”. The response for additional hours available could be for another job (jobs) in addition to the current job; replacing any of current jobs by another job with increased hours of work or longer time on the current job.

The distribution of employed population whether they were available or ready to work additional hours for urban areas of the country by age group and sex is shown in Table 5.27. Table 5.28 shows distribution of employed persons who sought or available to work additional hours together with the actual number of hours worked by age group and sex for the total urban areas of the country. Table 5.29 presents the distribution of urban employed population of each region who were sought or available to work additional hours classified by type of work sought or available for and sex.

5.9. Formal and Informal Sectors of the Economy

For statistical purposes, the informal sector is regarded as a group of production units, which according to the definitions and classification provided in the United Nation System of National Accounts (SNA Rev.4), form part of the household sector as household enterprises or, equivalently, unincorporated enterprises owned by households. The informal sector is defined irrespective of the kind of work place where the productive activities are carried out, the extent of fixed capital used, the duration of the enterprise and its operation as main or secondary activity of the owner.

The figures here were not referring to the whole employed population. In this survey, according to the 15th ICLS recommendations, those employed persons who were engaged in subsistence farming and work in private households were exempted from the analysis of the formal and informal sectors of the economic activity.

This survey includes questions to identify the employment sector of the economy and some of the characteristics in which the employed persons are engaged in their main activity. However, employed persons whose employment status were classified as employee-government, employee-government Development org., employee-non-governmental organization, or members of producers' cooperative were not necessary to ask such questions related to the activities of their sectors because they were considered as formal and later classified as being working in the formal sector.

On the other hand, other employed persons whose employment status were employer, employee of private organization, self employed, unpaid family worker and apprentice were asked the following questions whether the business /enterprise they were engaged in,

- a) Does the enterprise have book of account; or
- b) Does the enterprise have a license; or
- c) Does the product/Service of the organization you engaged in is mainly for market?

Based on the response to these three questions, classification on sector of economy was made as: formal, informal or “not identified”. Employed persons who satisfy at least one of the above conditions ('a' or 'b' answered 'yes') were considered as working in the formal sector. On the contrary, those who respond “no” for 'a' and 'b' and 'yes' for 'c', the activity was taken as informal. For those who don't know the situation about their main activity/business/ enterprise with respect to the above questions was labeled as “not identified”.

Table 5.30 presents the distribution of employed population of urban areas of the country in relation to the sector of the economy classified by age group and sex. The distribution of employed population by sector of economy, region and sex is presented in 5.31. Similar information for selected major town is shown in Table 5.32. Table 5.33-5.36 presents the cross classification of the informal sector by sex and region by some of the selected variables, such as major occupation and branches of economic sector, educational attainment and working place. The last Table 5.37 has shown the distribution of total employed population by Mean number of hours worked with major branches of economic sector in each region and sex.

CHAPTER VI

UNEMPLOYMENT IN URBAN AREAS

6.1. Introduction

Unemployment is one of the indicators that have been used to measure the extent of unutilized human resource in the economy at a given area or region in a certain period of time. It indicates the quantity and quality of the human labour a nation or a region would have, and should be used to promote its economic development, but not actually used. The unutilized human resource as a result of unemployment has its own social and economic implication. Therefore, the availability of reliable and timely statistical data on unemployment is vital to formulate and design new strategies as well as to monitor the existing employment policies.

A wide range of information regarding unemployment and the characteristics of unemployed population were collected in the 2014 Urban Employment and Unemployment Survey. This information is useful to estimate the number of unemployed population and rate of unemployment at various reporting levels.

This chapter presents the size of unemployed population and rate of unemployment at national, regional and major urban levels. In addition, the characteristics of unemployed population such as age, sex, education, training status, marital status, previous work experience, duration of unemployment, type of jobs looking for, problems in establishing own business or enterprise, actions taken to seek work ... etc., are presented in detail. These information were collected from persons aged ten years and above by using the two known measurement approaches, namely current and usual approaches. But, the results presented in this chapter refer only the current activity status approach.

During the data collection period, respondents in the sampled household were asked detailed labour force questions using structured questionnaires. These includes:-

- a. Whether they were seeking for employment, if not reason for not seeking.
- b. Whether available for work during the coming one month, if not reason for not being available.
- c. type of job looking for /i.e. self employment or paid employment or other/
- d. type of problems faced to establish own business.
- e. Previous work experience and duration of unemployment.

Based on the responses obtained from the respondents aged ten years and above, the measurement of unemployment was done using various methods.

6.2 Measurement of Unemployment

The measurement of unemployment is based on the following three criteria that must be satisfied simultaneously: “without work”, “currently available for work” ‘and “seeking work” (ILO, 1983). The standard definition of unemployment is based on the “seeking work” criterion that can be interpreted as activities or efforts that non-working persons performed to look for jobs during a specified reference period or prior to it (i.e., paid or self employment). The specific steps include registration at a public or private exchange; applying to employers; checking at worksites, farms, factory gates, market or other assembly places; placing or answering news paper advertisements; seeking assistance of friends or relatives; visit vacancy boards; looking for land, building, machinery or equipment to establish own enterprise, and arranging financial resources; applying for work permits and licenses...etc.

However, the standard definition of unemployment with its emphasis on seeking work criterion might be restrictive and might not fully capture the prevailing employment situations in many developing countries including Ethiopia, where the labour market is largely unorganized or of limited scope, where labour absorption is inadequate or where the labour force is largely self-employed.

Hence, the International standards introduced provisions, which allows for the relaxation of the seeking work criterion in certain situations. The provisions are two types, namely, partial relaxation and complete relaxation. Following the recommendations of the International standard and considering the prevailing national situations, the employment and unemployment and related labour force surveys used the above provisions to measure the different forms of unemployment. The definition of the two provisions is described as follows.

Under partial relaxation, the definition of unemployment includes discouraged job seekers, future start and layoffs in addition to persons satisfying the standard definition. Discouraged job seekers are persons who want a job but did not take any active step to search for work because they believe that they cannot find one. Future starts are those persons without work who have made arrangements to take up paid employment or to undertake self-employment activity at a date subsequent to the reference period. Layoff is a person whose contract of employment or activity has been suspended by the employer for a specified or unspecified period at the end of which the person concerned has a recognized right or recognized expectation to cover employment with the employer (ILO, 1990).

The completely relaxed definition of unemployment includes persons without work and those who are available for work, including those who were or were not seeking work. That is, the seeking work criterion is completely relaxed and unemployment is based on the “without work” and “availability” criterion only. The availability in this situation is tested by asking the willingness to take up work for wage or salary in locally prevailing terms, or readiness to undertake self-employment activity; given the necessary resources and facilities. It should be noted that fulltime students are considered as available if and only if they are ready to withdraw from their studies in order to accept a job.

This survey collected unemployment data in the standard, partially relaxed and completely relaxed options of measurements. After thorough evaluation and assessment of the results obtained using the three alternative and complementary measures; the rates obtained using the completely relaxed definition was found most

plausible and hence selected for reporting. In this survey, those persons aged ten years and above who had no work or did not work at least four hours or did not have job to return to, were asked to respond whether they were available or willing to work if job was found during the coming one month. Those who responded “Yes” answer to this question were further tested whether they were ready to take a job under prevailing conditions. By doing so, those persons who had no job but available to work are considered as unemployed at the time of the survey.

6.3. Size and Rate of Urban Unemployment

The proportion of unemployed population aged ten years and above is described using unemployment rate. Unemployment rate is computed as percentage of the unemployed population over the total number of economically active population. The rate indicates that the number of persons who are ready to participate or engaged in the production of goods and services. A higher rate of unemployment implies the loss of individual contributions to the growth of Growth Domestic Product (GDP) as well as the national economy, and hence a waste of human resource.

The distribution of unemployed population aged ten years and above and unemployment rate of urban areas of the country by region, age group and sex is presented in Table 6.1. The survey result reveals that the unemployment rate at national urban level was 16.9 percent. The corresponding rates for males and females were 9.4 percent and 24.7 percent, respectively (Table 6.1). Unemployment rate in the regions illustrates that the highest rate was recorded in Dire Dawa Administration (23.9 %) followed by Addis Ababa 21.0 percent, while the lowest rate as compared to the highest one was found in Gambella (8.2 percent) and Harari Region (10.4 percent) regions. But in the other regions of the country, the rate was found in the range between 11 – 21 percent (Table 6.1).

Table 6.2 shows the distribution of unemployed population of total major towns and sixteen selected major towns classified by age group and sex. The rate for total major tow was 19.2 percent. Among the major towns, the highest unemployment rate reported for Dessie town 22.6 percent and Adama town 21.5 percent next to Dire

Dawa Town 23.9 percent. The lowest unemployment rate as compared to the highest one was found in Gambella Town and Harar town 10.2 percent and 10.4 percent, respectively.

With regard to literacy status and educational attainment of the unemployed population by age group and sex for each region are shown in Table 6.3 and 6.4, while the training status and types of training of the unemployed illustrated in Table 6.5. The distribution of unemployed persons disaggregated by marital status, age group and sex is presented in Table 6.6. Table 6.7 shows similar information for each region classified by sex.

Those persons aged ten years and above who were looking for work during the last three months prior to date of interview were asked to report what steps they have taken to seek work and type of work they look for during this period. Accordingly, Table 6.8 presents the distribution of unemployed persons who were looking for work during the three months prior to the survey date by sex and step taken to seek work for urban areas of each region. Table 6.9 also provides data on types of job they were looking for by sex and region.

The size of unemployed persons of urban areas of the country categorized by age group, sex, previous work experience and duration of unemployment is presented in Table 6.10. The corresponding figure by sex and region is presented in Table 6.11. The distribution of unemployed persons according to the type of problems they faced to start own business by region and sex is shown in Table 6.12.

ANNEX II

Estimation Procedures of Total, Ratio and Sampling Errors

The following formulas were used to estimate the required variables by reporting levels.

1. Estimate of Total \hat{Y}_h in Major Urban Domain (Category I)

$$\hat{Y}_h = \sum_{i=1}^{n_h} \sum_{j=1}^{h_{hi}} W_{hi} Y_{hij}$$

Where,

$$W_{hi} = \frac{M_h H_{hi}}{n_h M_{hi} h_{hi}} \text{ is the basic sampling weight}$$

2. Estimate of Total \hat{Y}_h in Other Urban Domain (Category II)

$$\begin{aligned}\hat{Y}_h &= \sum_{i=1}^{n_h} \frac{M_h}{n_h n_{hi}} \sum_{j=1}^{n_{hi}} \frac{H_{hij}}{M_{hij} h_{hij}} \sum_{k=1}^{h_{hij}} Y_{hijk} \\ &= \sum_{i=1}^{n_h} \sum_{j=1}^{n_{hi}} \sum_{k=1}^{h_{hij}} W_{hij} Y_{hijk}\end{aligned}$$

Where,

$$W_{hij} = \frac{M_h H_{hij}}{n_h n_{hi} M_{hij} h_{hij}} \text{ is basic sampling weight}$$

The following notations were used in the formula:

M_h = Total number of households in stratum h obtained from the sampling frame.

M_{hi} = Total number of households in EA/PSU i for major urban domain or in urban center/PSU i for other urban domain, stratum h obtained from the sampling frame.

H_{hi} = Total number of households obtained from the survey listing in sample EA/PSU i stratum h for major urban domain.

h_{hi} = Total number of households successfully covered in EA/PSU i stratum h for major urban domain.

M_h = Total number of households of the domain in stratum h obtained from the sampling frame

n_h = Number of successfully covered urban centers for other urban domain / covered EAs for major urban domain in stratum, h.

M_{hi} = Total number of households in EA/PSUi in stratum h obtained from the sampling frame

$h_{hi=}$ = Total number of sampled and covered households in sampled EA/PSUi , and stratum h

\hat{Y}_{hij} = The observed value of characteristic y for household j, in EA/PSUi, stratum h of Major Urban Domain

M_{hij} = Total number of households in EA/SSU j, urban centers/PSU i and stratum h obtained from the sampling frame for other urban center domain.

n_{hi} = Number of sample EAs successfully covered in urban center/PSU i and stratum h for other urban center domain.

H_{hij} = Total number of households obtained from the survey listing in EA/SSU j, urban center/PSU i and stratum h for other urban center domain

h_{hij} = Number of sample households successfully covered in EA /SSU j, urban center/PSU i and stratum h for other urban center domain.

Y_{hijk} = The observed value of a characteristic y for household k in EA/SSUj, urban center/PSU i and stratum h for other urban domain.

Note: Estimate of total at country level, \hat{Y} , is obtained by summing up stratum/domain total estimates.

$$\hat{Y} = \sum_h \hat{Y}_h$$

3. Sampling Variance of the Estimates:

Sampling variance of estimate of stratum total are given by the following formulas:

The variance of domain or reporting total estimate is:

$$Var(\hat{Y}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{Y}_{hij} - \frac{\hat{Y}_{hi}}{h_{hi}} \right)^2$$

in which $\hat{Y}_{hi} = W_{hi} \sum_{j=1}^{h_{hi}} Y_{hij}$ for major urban centers domains,

and $\hat{Y}_{hi} = \sum_{j=1}^{n_{hi}} W_{hij} \sum_{k=1}^{h_{hij}} y_{hijk}$ for other urban center domain.

$$V(\hat{Y}) = \sum_h V(\hat{Y}_h)$$

$$SE(\hat{Y}_h) = \sqrt{Var(\hat{Y}_h)}$$

4. Coefficient of Variation (CV) and Confidence Interval (CI)

The following formulas were used to calculate CV and CI of the domain (reporting level) total.

The coefficient of variation (CV) of domain total in percentage is:

$$CV(\hat{Y}_h) = \frac{\sqrt{Var(\hat{Y}_h)}}{\hat{Y}_h} * 100$$

and Ninety-five percent confidence interval (CI) of domain total:

$$\hat{Y}_h \pm 1.96 * SE(\hat{Y}_h)$$

5. Ratio Estimates:

$$\hat{R}_h = \frac{\hat{Y}_h}{\hat{X}_h} \text{ and } \hat{R} = \frac{\hat{Y}}{\hat{X}}$$

Where the numerator and the denominator are estimates of domain totals of characteristic, y and x, respectively.

$$Var(\hat{R}_h) = \frac{1}{\hat{X}_h^2} [Var(\hat{Y}_h) + \hat{R}_h^2 Var(\hat{X}_h) - 2\hat{R}_h Cov(\hat{Y}_h, \hat{X}_h)]$$

In which

$$Cov(\hat{Y}_h, \hat{X}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right) \left(\hat{X}_{hi} - \frac{\hat{X}_h}{n_h} \right) + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{Y}_{hij} - \frac{\hat{Y}_{hi}}{h_{hi}} \right) \left(\hat{X}_{hij} - \frac{\hat{X}_{hi}}{h_{hi}} \right)$$

ANNEX - III

ANNEX TABLE 1. Urban Population Aged Ten Years And Over By Age Group, Sex and Activity Status During the Last Seven Days (Current Status Approach) – Country Total: 2016

Age Group and Sex	All Person	CV	Active	CV	Non-Active	CV
